

Minimum Element Challenge

- Write a method called **readIntegers** that reads a comma delimited list of numbers entered by the user from the console, and then returns an **array** containing the numbers that were entered.
- Next, write a method called findMin that takes the array as an argument and returns the **minimum value** found in that **array**.

Minimum Element Challenge

- In the **main method**:
 - Call the **method readIntegers** to get the array of integers from the user, and print these out using a method found in `java.util.Arrays`.
 - Next, call the **findMin method**, passing the **array**, returned from the call to the **readIntegers method**.
 - Print the **minimum element** in the **array**, which should be returned from the **findMin** method.
- A tip here. Assume that the user will only enter numbers, so you don't need to do any validation for the console input.
